

Subject: Re: Latest delivery, all five rows rechecked

Hi [Name],

Thanks for flagging this so quickly. If labels on your data are wrong, that's a problem for us too, so I rechecked all five responses myself before replying.

All three flags hold up, so this batch doesn't have the 40% error rate it looked like:

1. **Asbestos (row 2).** The response calls asbestos "a synthetic substance." It's a naturally occurring mineral fiber found in rock and soil. Source: [EPA, Learn About Asbestos](#)
2. **The Beatles (row 5).** The song list includes "Imagine," a John Lennon solo song released in 1971, after the band split. Source: [History.com, Imagine released](#)
3. **Evaporation (row 4).** The response says evaporation only happens "above freezing." Water still turns to vapor below 0°C, as ice, through sublimation. Source: [USGS, Sublimation and the Water Cycle](#). This one is subtler, and I can see it being read as a simplification.

The two rows marked Accurate also hold up.

Could you tell me which of the three your team saw as correct? If it's evaporation, we should agree together on how strict the rubric is for simplifications.

Where we fell short: we sent labels without the reasons behind them, so your team had to redo our research. From your next delivery, every flag will include the exact claim, the correction, and a linked source, like above. We'll also agree on a strictness bar with you before rating starts, and a second reviewer will check every flag.

On billing, since the labels hold up, I would rather not treat this delivery as flawed. I would suggest a 20 minute call with your QA lead this week. If any label still doesn't meet your standard after that, we'll have it rated again at no cost and credit that portion of the invoice.

Thanks for pushing on this. It will make the next batch better for both of us.

Best,
